Thank you for purchasing XD Studio, 200 patches for Korg Minilogue XD and XD Module

Please, make sure your synth and your librarian are up to date on korg.com. We assume the librarian is installed on your computer and the minilogue XD is connected via USB. We assume you are aware of how the librarian works but please find some tips below.

Please make sure you made a backup of your own patches before uploading this bank to your Minilogue XD or XD Module

The file you got is a library file, it contains 200 patches that are stored by default in memories from 200 to 399.

You can send all the patches at once to your synth if you wish using send all, again make you sure have backed up your synth before.

In case you want to send a patch to a specific memory location (so you can match/mix with your own already installed patches), choose the memory number where you want to send the patch on your Minilogue XD, example: slot number 500, then clic on the patch name in the librarian. This will send the patch temporarily so can try it playing on your synth. If you like it you can store it, in the memory 500 in this example, using the write function on the XD synth so it will be there when you reboot your synth.

So actually, you have 2 options: send all patches, it will fill slots from 200 to 399; or put any patch (one by one) to any memory slot you want.

Thanx again for your purchase and enjoy the sounds.
